

Water Demand Calculator Study

EXECUTIVE SUMMARY

Stantec Architecture Inc. was commissioned by IAPMO to develop a prototype Single Family Residence plumbing plan, a 6-Unit Family Residence plumbing plan, and a 45 – Unit Family Residence plumbing plan in order to compare the cold and hot water sizing criteria associated with IAPMO’s – Water Demand Calculator (WDC) to the sizing methods contained within the Uniform Plumbing Code (UPC) the International Plumbing Code (IPC) and the International Residential Code (IRC).

The plumbing industry has long recognized that building potable water systems in today’s buildings are oversized. This presents a growing health and safety concern, as problems associated with declining water quality, such as Legionella, have been steadily increasing in recent years and are strongly correlated to water aging due to longer water residence times in plumbing systems.

Responding to this need, IAPMO initiated a project to develop the WDC to provide a new water supply sizing method that takes modern water usage patterns into account. It represents the first statistically based sizing method since the 1940’s and is a product of a multi-year research project between IAPMO, the American Society of Plumbing Engineers (ASPE), the Water Quality Research Foundation (WQ-RF) and the University of Cincinnati.

The impetus behind the development of the WDC is multi-faceted. Most importantly, and consistent with IAPMO’s imperative to address health and safety concerns as a priority, the WDC works to accurately predict water use patterns in residential buildings so that water pipes are properly sized, significantly reducing water aging in buildings. Use of the WDC also provides for faster hot water delivery times throughout the hot water systems. As such, it will also save energy, water, and reduce utility bills for the entire life of the plumbing system.

The WDC provides the above benefits while also working to reduce residential construction costs. This study provides estimates of probable cost for copper water piping and PEX water piping that were developed for each prototype. Estimates of probable costs were calculated for prototypes in the high cost New York City market, the medium cost Pittsburgh, PA market and the lower cost Oklahoma City, OK construction markets.

The results of the study indicate when the Water Demand Calculator is used, there are notable construction cost savings associated with each of the three residential prototype water service entrances, interior cold water mains / branches, interior hot water mains / branches, fittings, labor, and appurtenances.

UNIFORM PLUMBING CODE

The Uniform Plumbing Code (UPC) is a model code developed by the International Association of Plumbing and Mechanical Officials (IAPMO) to govern the installation and inspection of plumbing systems as a means of promoting the public's health, safety and welfare.

The UPC is developed as American National Standards using consensus development procedures accredited by the American National Standards Institute (ANSI). This process brings together volunteers representing a variety of viewpoints and interests to achieve consensus on plumbing practices.

The UPC applies to all building types and includes potable water, building supply, and distribution pipes; all plumbing fixtures and traps; all drainage and vent pipes; all building drains, and building sewers, including their respective joints and connections, devices, receptors, and appurtenances within the premises property lines. This includes potable water piping, potable water treating or using equipment, medical gas and medical vacuum systems, liquid and fuel gas piping, water heaters and vents for same. Appendix M, which details the use of the Water Demand Calculator, was approved by the UPC's Technical Committee for the 2018 edition of the UPC.

IAPMO's Water Efficiency and Sanitation Standard (WE•Stand) is also published as an American National Standard and replaced the Green Plumbing and Mechanical Code Supplement. The publication of WE•Stand is noteworthy, as it is the first-ever ANSI standard that focuses solely on achieving safe and efficient water use in all building types, including single and multi-family dwellings.

The 2017 WE•Stand Technical Committee was comprised of 29 leading industry experts. The provisions contained in the standard reflect centuries of collective experience and knowledge which included; representation from code officials, manufacturers, plumbing engineers, contractors, the plumbing trades, water-efficiency proponents, water utilities, landscape irrigation experts, representatives of other associations and academia. The 2017 WE•Stand contains the latest comprehensive provisions aimed at achieving safe and reliable water efficiencies in and around buildings and includes the Water Demand Calculator in the Appendices.

The Water Demand Calculator is a new computational model that predicts peak water demand for single- and multi-family dwellings. It replaces the Hunter method by directly calculating the peak demand without the use of fixture units and a curve. It does this by using three different algorithms depending upon the size of the building as shown in Table 1 - Methods to estimate peak demands in residential buildings with efficient fixtures. As the

number of fixtures increase, the WDC shifts to the appropriate algorithm as shown in of Figure 1- Flow of Algorithms. Both the UPC and WE•Stand contain detailed provisions on how to use the WDC for estimating water demand and pipe sizing.

Table 1
Methods to estimate peak demands in residential buildings with efficient fixtures.

Region in Figure 4-10	Building Size	Algorithm in Water Demand Calculator	Boundary Criteria	Probability of Peak Period Stagnation, P_0
Green ●	Small	Exhaustive Enumeration [ExEn]	$n \leq 30$	Very High
Yellow ●	Medium	Modified Wistort Method [MWM]	$n > 30$ $H < 5$	Moderate
Red ●	Large	Wistort Method [WM]	$H \geq 5$	Very Low

Figure 1
Flow of Algorithms

The Water Demand Calculator includes several features to assist in properly sizing a cold and hot water system. The most significant feature is a drop-down menu that offers a building type. The multi-family option activates two selections between a single and multi-family residence with additional input boxes that require the user to specify the total number of residential units that are (a) in the building and (b) in the calculation. The latter entry is dynamically linked to the probability of fixture use column in the calculator, gradually reducing the percentage as the number of residential units increase in a building. This calibrated feature assures accurate predictions of peak water demand in large multi-family dwellings.

Another feature of the Water Demand Calculator is the display of additional computed information pertaining to the peak conditions. Besides providing the total fixture count and the 99th percentile demand flow, the Water Demand Calculator provides the average number of simultaneous use fixtures at any instant during the peak period (called the Hunter Number) and the probability of no flow (stagnation).

COMPUTED RESULTS FOR PEAK PERIOD CONDITIONS

- Total No. of Fixtures in Calculation: n = 128
- 99th Percentile Demand Flow: Q = 18.8 GPM
- Hunter Number: H(n,p) = 2.00
- Stagnation Probability: Pr(Zero Demand) = 13%

Annotations:

- White cells accept input values. NOTE: Active cells are highlighted in yellow.
- Click for Drop-down Menu →
- Click to Select Building Type
- Enter Total Number of Apartments in the Building (integer ≥1)
- NOTE: This value does not affect the results in this calculation; however, the Total Number of Apartments in Building must be ≥ the Total Apartments in this Calculation.
- Enter Number of Apartments Considered in this Calculation. (integer ≥1)
- Sum of fixtures entered in the calculator.
- Demand flow in the selected units of measurement.
- Average number of fixtures in use at any instant.
- Probability of no fixtures in use at any instant.
- Enter 'Other Fixture' Probability of use (0.1 - 6%) in [Column C]
- Enter 'Other Fixture' flow rate in [Column D]
- Downloads the current result to a file named WDCResults-DDMMYY-hhmmss.txt in the "Downloads" folder.
- CLICK BUTTON
- If visible, fixture combination has changed. Therefore run water demand calculator for a new result.
- If visible, there is an entry for "Other fixture". Enter appropriate fixture p-value and flow rate (GPM, LPM, or LPS).

Buttons: DOWNLOAD RESULT, RESET WDC, GPM, LPM, LPS, RUN WDC

Select Units for Water Demand: GPM, LPM, LPS

Select from these units of measurement: GPM - Gallons per minute, LPM - Liters per minute, LPS - Liters per second.

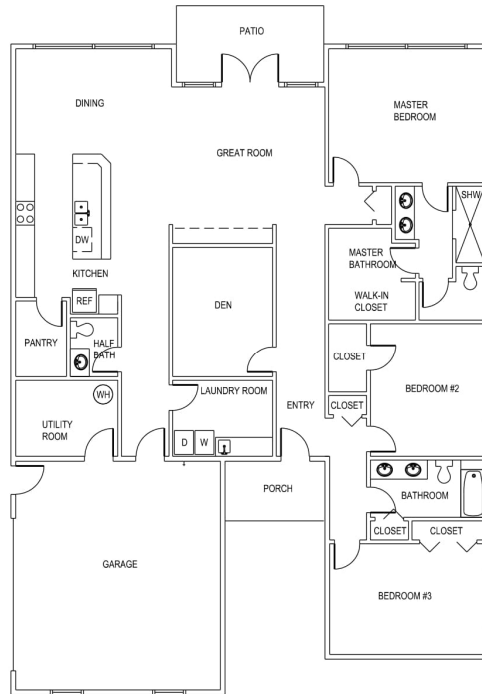

Click to reset number of fixtures

SCOPE OF STUDY

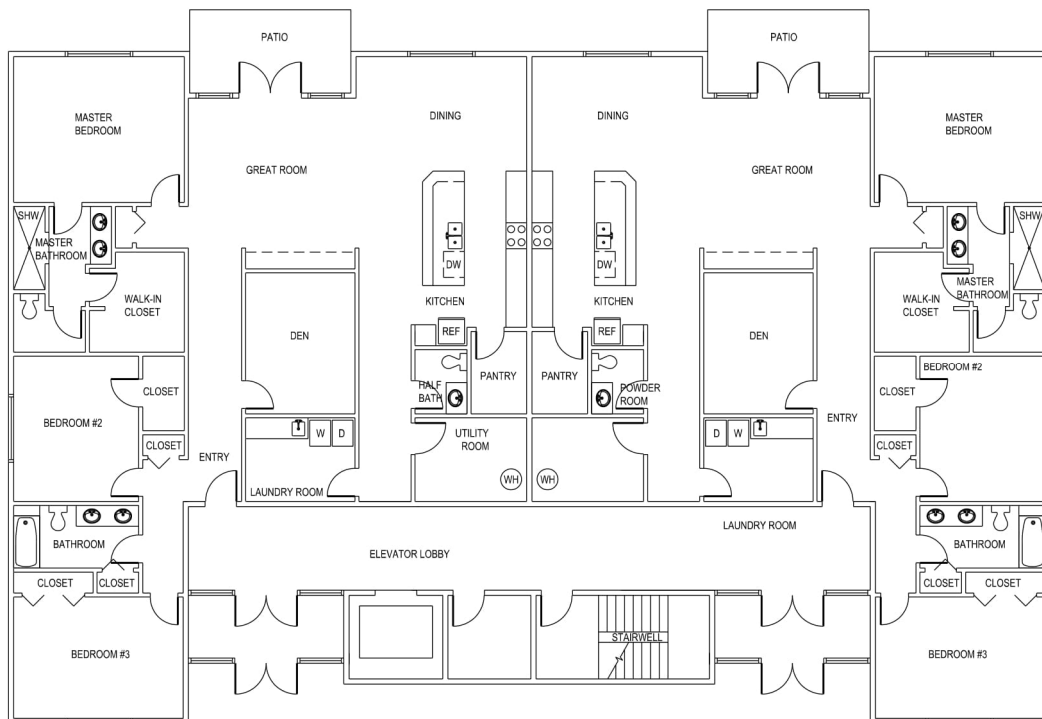

The water piping design associated with each residence was based on the minimum water requirements of the UPC Appendix M – Peak Water Demand Calculator, the UPC, IPC and IRC. The same basis of design, pipe configuration, and flow velocities were applied to each prototype. NOTE: To ensure a fair comparison, the most economic design options offered in the entirety of the UPC, IPC, and IRC were investigated and applied, including the application of the code appendices.

A. PROTOTYPES

1. The Single Family Residence prototype represents an average single floor home that is approximately 2,379 square feet (excluding garage). Primary spaces include a: Great Room, Dining Room, Kitchen, Den, Master Bedroom, Master Bathroom, Bedroom #1, Bedroom #2, Bathroom, Half Bath, Laundry Room, and Utility Room.

- The 6 Unit Multi-Family Residence prototype represents a three story building with two large residential units on each floor. Each residential unit is approximate 2,379 square feet. Primary spaces include a: Great Room, Dining Room, Kitchen, Den, Master Bedroom, Master Bathroom, Bedroom #1, Bedroom #2, Bathroom, Half Bath, Laundry Room, and Utility Room.

- The 45 Unit Multi-Family Residence prototype represents a five story building with nine average size residential units on each floor. Each residential unit has is approximately 1,002 square feet. Primary spaces include a: Great Room, Kitchen, Master Bedroom, Master Bathroom, Bedroom #1, Bathroom, and Utility / Laundry Room.

B. PLUMBING CALCULATIONS

- Plumbing fixture water sizing associated with the UPC - Water Demand Calculator was based on: Appendix M – Peak Water Demand Calculator which provides the method for estimating the water demand associated with Single Family and Multi-Family residences using water conserving plumbing fixtures and appliances typically installed in residential buildings. It should be noted that the cost of the plumbing fixtures and appliances are not included in the material cost calculations as are they are identical in the WDC, UPC, IPC and IRC model calculations.

Total Flow Based on Hunter's Curve:									105.1	96.1	143.8
45 Unit Residence Water Entrance Size - Based on a maximum flow rate of 8 FPS = 3"											

C. **PIPE SIZING**

1. Cold water pipe sizing was based on a maximum flow rate of 8 feet per second
2. Hot water pipe sizing was based on a maximum flow rate of 5 feet per second

D. **PIPE MATERIALS**

1. Copper Piping Systems: Cold water and hot water risers, mains, branches, and fittings – Type L copper with lead free soldered joints. (Images are examples of system components)

2. PEX Piping Systems: Cold water and hot water mains and branches (2-inches and smaller) PEX pipe with mechanical joints (Images are example of system components). Cold water and hot water risers and fittings (2-1/2 inches and larger) – Type L copper with lead free soldered joints.

E. RESULTS: ESTIMATES OF PROBABLE COST (US Dollars)

1. Estimate of probable cost of construction for each prototype were developed for (a) New York City, (b) Pittsburgh, Pa., and (c) Oklahoma City based on RS Means.

a) **New York City**

Single Family Residence	Estimate of Probable Cost (Cold / Hot Water) Based on Type L copper with soldered joints	Estimate of Probable Cost (Cold / Hot Water) Based on PEX with insert crimp ring fittings
UPC – Water Demand Calculator	\$23,912	\$21,116
UPC	\$24,313	\$21,213
IRC	\$25,038	\$21,197

Note: Estimate of probable costs have been rounded to the nearest dollar, refer to Appendix for estimate of probable cost breakdown.

6 Unit Multi-Family Residence	Estimate of Probable Cost (Cold / Hot Water) Based on Type L copper with soldered joints	Estimate of Probable Cost (Cold / Hot Water) Based on PEX with insert crimp ring fittings
UPC – Water Demand Calculator	\$133,381	\$106,062
UPC	\$137,376	\$115,544
IPC	\$140,983	\$115,074

Note: Estimate of probable costs have been rounded to the nearest dollar, refer to Appendix for estimate of probable cost breakdown.

45 Unit Multi-Family Residence	Estimate of Probable Cost (Cold / Hot Water) Based on Type L copper with soldered joints	Estimate of Probable Cost (Cold / Hot Water) Based on PEX with insert crimp ring fittings
UPC – Water Demand Calculator	\$614,283	\$577,627
UPC	\$666,692	\$610,781
IPC	\$673,160	\$604,121

Note: Estimate of probable costs have been rounded to the nearest dollar, refer to Appendix for estimate of probable cost breakdown.

b) Pittsburgh, Pa.

Single Family Residence	Estimate of Probable Cost (Cold / Hot Water) Based on Type L copper with soldered joints	Estimate of Probable Cost (Cold / Hot Water) Based on PEX with insert crimp ring fittings
UPC – Water Demand Calculator	\$14,385	\$12,803
UPC	\$14,684	\$12,890
IRC	\$15,242	\$12,875

Note: Estimate of probable costs have been rounded to the nearest dollar, refer to Appendix for estimate of probable cost breakdown.

6 Unit Multi - Family Residence	Estimate of Probable Cost (Cold / Hot Water) Based on Type L copper with soldered joints	Estimate of Probable Cost (Cold / Hot Water) Based on PEX with insert crimp ring fittings
UPC – Water Demand Calculator	\$80,096	\$62,193
UPC	\$83,246	\$70,702
IPC	\$86,252	\$70,405

Note: Estimate of probable costs have been rounded to the nearest dollar, refer to Appendix for estimate of probable cost breakdown.

45 Unit Multi - Family Residence	Estimate of Probable Cost (Cold / Hot Water) Based on Type L copper with soldered joints	Estimate of Probable Cost (Cold / Hot Water) Based on PEX with insert crimp ring fittings
UPC – Water Demand Calculator	\$367,529	\$346,850
UPC	\$408,215	\$375,076
IPC	\$412,516	\$369,385

Note: Estimate of probable costs have been rounded to the nearest dollar, refer to Appendix for estimate of probable cost breakdown.

c) Oklahoma City

Single Family Residence	Estimate of Probable Cost (Cold / Hot Water) Based on Type L copper with soldered joints	Estimate of Probable Cost (Cold / Hot Water) Based on PEX with insert crimp ring fittings
UPC – Water Demand Calculator	\$11,036	\$9,839
UPC	\$11,313	\$10,168
IRC	\$11,980	\$9,913

Note: Estimate of probable costs have been rounded to the nearest dollar, refer to Appendix for estimate of probable cost breakdown.

6 Unit Multi-Family Residence	Estimate of Probable Cost (Cold / Hot Water) Based on Type L copper with soldered joints	Estimate of Probable Cost (Cold / Hot Water) Based on PEX with insert crimp ring fittings
UPC – Water Demand Calculator	\$61,327	\$45,962
UPC	\$64,364	\$53,783
IPC	\$67,360	\$54,630

Note: Estimate of probable costs have been rounded to the nearest dollar, refer to Appendix for estimate of probable cost breakdown.

45 Unit Multi - Family Residence	Estimate of Probable Cost (Cold / Hot Water) Based on Type L copper with soldered joints	Estimate of Probable Cost (Cold / Hot Water) Based on PEX with insert crimp ring fittings
UPC – Water Demand Calculator	\$280,292	\$263,352
UPC	\$319,092	\$291,872
IPC	\$322,733	\$286,113

Note: Estimate of probable costs have been rounded to the nearest dollar, refer to Appendix for estimate of probable cost breakdown.

F. RESULTS: ESTIMATES OF PROBABLE COST (US Dollars / Percent Savings)

- The tables below show the construction costs savings of the WDC based on a US dollar / percentage basis compared to both the UPC, IPC, and IRC. These values may be useful for readers of this study to understand the cost savings that can be expected when applying the Water Demand Calculator.

G. FINDINGS

1. Due to reduced GPM requirements, the application of IAPMO’s Water Demand Calculator resulted in notable construction cost savings associated with each of the three residential prototypes. The primary cost savings are associated with reduced diameter water service entrances, interior cold water mains / branches, interior hot water mains / branches, fittings, labor, and appurtenances.
2. The Water Demand Calculator is a Uniform Plumbing Code alternative to Hunter’s Curve for estimating water supply demand for residential buildings. This represents the first practical application of an improved method since the 1940’s that does not result in excessive over design and oversizing pipes.
3. The Water Demand Calculator works in conjunction with commonly accepted rules and procedures for sizing cold and hot water systems.
4. Utilizing the Water Demand Calculator for sizing of residential cold and hot water mains, branches and risers will result in:
 - a) Shorter water dwell times in residential plumbing systems will improve water quality and thus, most importantly, improve public health and safety.
 - b) Reduced water service entrance, interior cold water mains / branches, interior hot water mains / branches, fittings, labor, and appurtenances.
 - c) Faster hot water delivery times throughout the hot water systems, will also save energy, water, and reduce utility bills for the entire life of the plumbing system.
